

## TARGET / OUTCOME INDICATORS

*Learning how to compost biowaste is one of the ways to reduce residual household waste (what is left in the grey waste bin) especially for people living in collective housing.*

## THE GOALS FIXED IN 2012 HAVE BEEN ACHIEVED

"Waste on a diet" aimed to achieve three targets by 2016:

- Reducing the weight of residual household waste from 217 kg/year/capita in 2009 to 150 kg. This goal is **almost reached** because in 2016, the grey waste bin weights **154 kg per year per resident**. Let's continue our efforts !
- Increasing material recovery (recycling and composting) from 38% in 2009 to 55%. This purpose was attained and the **material recovery rate is 55%**.
- Controlling costs for the inhabitants and remain below € 90 per capita. Currently, the fee costs **€ 72/year /capita** .

## RESULTS (30/06/2016)

	2009	2014	2016
Residual waste (/year/capita)	217	154	154
Storage of bulky waste (tons)	11,682	9,980	4,200
Recycling rate (%)	39	48	55
Collective composting sites	0	236	304
Cost per inhabitant (€)	66	72	72
